#### **TO BE VERY CAREFUL !**

The LCD driver ICs are made by CMOS process, which are very easy to be damaged by static charge, make sure the user is grounded when handling the LCM.

## ABSOLUTE MAXIMUM RATING

(1) Electrical Absolute Ratings

| Item                   | Symbol                           | Min. | Max.              | Unit | Note |
|------------------------|----------------------------------|------|-------------------|------|------|
| Power Supply for Logic | V <sub>DD</sub> -V <sub>SS</sub> | -0.3 | 7.0               | Volt |      |
| Power Supply for LCD   | V <sub>DD</sub> -V <sub>O</sub>  | -0.3 | 12.0              | Volt |      |
| Input Voltage          | VI                               | -0.3 | V <sub>DD</sub> / | Volt |      |
| LED Power Dissipation  | P <sub>AD</sub>                  | -    | 144               | mW   |      |
| LED Forward current    | I <sub>AF</sub>                  | -    | 40                | mA   |      |
| LED Reverse Voltage    | VR                               | -    | 5                 | V    |      |

#### (2) Environmental Absolute Maximum Ratings

|                                | Normal Temperature |       |       |         | Wide Temperature |           |       |       |  |
|--------------------------------|--------------------|-------|-------|---------|------------------|-----------|-------|-------|--|
| Item                           | Operating          |       | Sto   | Storage |                  | Operating |       | rage  |  |
|                                | Min,               | Max.  | Min,  | Max.    | Min,             | Max.      | Min,  | Max.  |  |

#### **COMMANDS DESCRIPTION Clear Display**

| RS | R/W | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 0  | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 1   |

Clear all the display data by writing "20H" (space code) to all DDRAM address, and set DDRAM Address to "00H" into AC (address counter). Return cursor to the original status .namely , bring the Cursor to the left edge on first line of the display . Make entry mode increment (I/D="1") .

#### **Return Home**

| RS | R/W | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 0  | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 1   | *   |

Return Home is cursor return home instruction . Set DDRAM address to "00H" into the address Counter . Return cursor to its original site and return display to its original status, if shifted . Content of DDRAM is not changed .

#### **Entry Mode Set**

| RS | R/W | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 0  | 0   | 0   | 0   | 0   | 0   | 0   | 1   | I/D | S   |

Set the moving direction of cursor and display.

#### I/D : Increment/ decrement of DDRAM address (cursor or blink)

When I/D= "High", cursor/blink moves to right and DDRAM address is increased by 1. When I/D= "Low", cursor/blink moves to left and DDRAM address is increased by 1. \*CGRAM operates the same as DDRAM, when read from or write to CGRAM.

#### S: Shift of entire display

When DDRAM read (CGRAM read/write) operation or S = "Low", shift of entire display is not performed . If S = "High" and DDRAM write operation , shift of entire display is performed according to I/D value (I/D ="1", shift left, I/D = "0": shift right).

#### **Display ON/OFF Control**

| _ | RS | R/W | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
|---|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
|   | 0  | 0   | 0   | 0   | 0   | 0   | 1   | D   | С   | В   |

Control display/cursor/blink ON/OFF 1 bit register . D : Display ON/OFF control bit When D = "High", entire display is turned on. When D = "Low", display is turned off, but Display data is remained in DDRAM. C : Cursor ON/OFF control bit When C ="High", cursor is turned on. When C = "Low", cursor is disappeared in current display, but I/D register remains its data. B : Cursor Blink ON/OFF control bit When B = "High", cursor blink is on, that performs alternate between all the high data and When B = "Low", blink is off.

#### **Cursor or Display Shift**

| RS | R/W | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 0  | 0   | 0   | 0   | 0   | 1   | S/C | R/L | *   | *   |

Without writing or reading of display data, shift right /left cursor position or display. This instruction is used to correct or search display data . (Refer to Table 4 ) During 2-line mode display, cursor moves to the 2<sup>nd</sup> line after 40<sup>th</sup> digit of 1<sup>st</sup> line. Note that display shift is performed simultaneously in all the line. When displayed data is shifted repeatedly, each line shifted individually. When display shift is performed, the contents of address counter are not changed.

| S/C | R/L | Operation                                                                     |
|-----|-----|-------------------------------------------------------------------------------|
| 0   | 0   | Shift cursor to the left, AC is decreased by 1.                               |
| 0   | 1   | Shift cursor to the right, AC is increased by 1.                              |
| 1   | 0   | Shift all of the display to the left, cursor moves according to the display.  |
| 1   | 1   | Shift all of the display to the right, cursor moves according to the display. |

#### **Function Set**

| RS | R/W | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 0  | 0   | 0   | Ó   | 0   | DL  | N   | F   | *   | *   |

#### DL : Interface data length control bit

When DL = "High", it means 8-bit bus mode with MPU.

When DL = "Low", it means 4-bit mode with MPU. So to speak, DL is a signal to select 8-bit Or 4-bit bus mode. When 4-bit bus mode, it needs to transfer 4-bit data by two times.

#### N : Display line number control bit

When N = "Low", it means 1-line display mode.

When N = "High", 2-line display mode is set.

#### F: Display font type control bit

When F ="Low", it means 5\*8 dots format display mode When F ="High", 5\*11 dots format display mode.

#### Set CG RAM Address

| RS | R/W | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |  |
|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|--|
| 0  | 0   | 0   | 1   | AC5 | AC4 | AC3 | AC2 | AC1 | AC0 |  |

Set CGRAM address to AC.

This instruction makes CGRAM data available from MPU.

#### Set DD RAM Address

| RS | R/W | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 0  | 0   | 1   | AC6 | AC5 | AC4 | AC3 | AC2 | AC1 | AC0 |

Set DDRAM address to AC.

This instruction makes DDRAM data available from MPU.

When 1-line display mode (N=0), DDRAM address is from "00H" to "4FH". In 2-line display mode (N = 1), DDRAM address in the  $1^{st}$  line is from "00H" to "27H", and DDRAM address in the  $2^{nd}$  line is from "40H" to "67H".

#### **Read Busy Flag and Address**

| _ |   |   |    | DB6 |     |     |     |     |     |     |
|---|---|---|----|-----|-----|-----|-----|-----|-----|-----|
|   | 0 | 1 | BF | AC6 | AC5 | AC4 | AC3 | AC2 | AC1 | AC0 |

This instruction shows whether KS0066U is in internal operation or not . If the resultant BF is High,

It means the internal operation is in progress and you have to wait until BF to be Low , and then the Next instruction can be performed . In this instruction you can read also can read also the value of address counter .

#### Write Data RAM

| RS | R/W |    | DB6 | 220 | 22. | 225 | DB2 |    | DDU |
|----|-----|----|-----|-----|-----|-----|-----|----|-----|
| 1  | 0   | D7 | D6  | D5  | D4  | D3  | D2  | D1 | D0  |

Write binary 8-bit data to DDRAM/CGRAM . The selection of RAM form DDRAM , CGRAM , is set by the previous address set instruction : DDRAM address set , CGRAM address set . RAM set instruction can also determine the AC direction to RAM . After write operation , the address is automatically increased/decreased by 1 , according to the entry mode .

#### **Read Data to RAM**

| RS | R/W | DB7 | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0 |
|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 1  | 0   | D7  | D6  | D5  | D4  | D3  | D2  | D1  | D0  |

Read binary 8-bit data from DDRAM/CGRAM . The selection of RAM is set by the previous address set instruction . If address set instruction of RAM is not performed before this instruction , the data that read first is invalid , because the Direction of AC is not determined . If you read RAM data several times without RAM address set instruction before read operation , you can get correct RAM data from the second , but the first data would be incorrect , because there is no time margin to transfer RAM data . In case of DDRAM read operation , cursor shift instruction plays the same role as DDRAM address Counter is automatically increased/decreased by 1 according to the entry mode .After CGRAM read Operation , display shift may not be executed correctly .

**NOTE** : In case of RAM write operation, after this AC is increased/decreased by 1 like read Operation. In this time, AC indicates the next address position, but you can read only the previous Data by read instruction.

### **DD RAM ADDRESSING**

For 10\*4 Display
